Supervisors : Karel Brinda, Leo Ackermann

October 23, 2025

# XZ in short

## 1. sliding window algorithm to detect matches

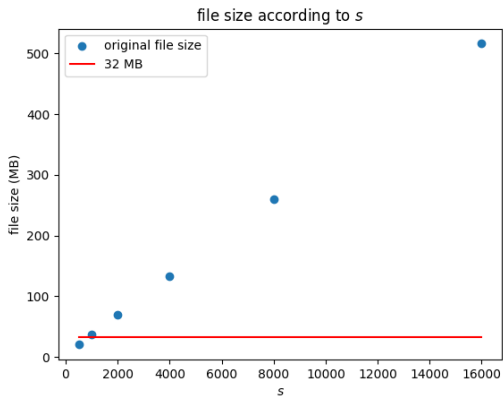

Output : (d1, 3)

## 2. range encoding of the output

# XZ presets memory constraints

Preset	DictSize (MiB)	min file size (MiB)
1	1	0.5
2	2	1
3	4	2
4	4	2
5	8	4
6	8	4
7	16	8
8	32	16
9	64	32

# File size according to $s$

# Compression ratio of XZ/GZIP over an archive

Compression ratio of neisseiria gonorrhoeae according to sketch size

XZ compression ratio

GZIP compression ratio

# Analysis

Observations :

- ▶ low compression rate for high presets
- ▶ plateau for high presets for smaller values of  $s$

Possible explanation :

- ▶ Too high redundancy because of mash format and phylogenetic closeness

Todo :

- ▶ look into a reformatting of .msh files (change compression order or smaller representation)
- ▶ try using specific algorithms for small values/increasing order
